

ArduPilot Implementation of Optimal Control for Tilt Rotor UAV Landing

A thesis submitted in part fulfilment of the degree of
Bachelor of Engineering (Honours)

by
Lincoln Karavas
U7091679

Supervisor: Mr. Mathew Hampsey
Examiner: Prof. Robert Mahony

College of Engineering and Computer Science
The Australian National University

October 2026

This thesis contains no material which has been accepted for the award of any other degree or diploma in any university. To the best of the author's knowledge, it contains no material previously published or written by another person, except where due reference is made in the text.

Abstract

The abstract should be brief (100–150 words) and directed to readers familiar with the broad area of the thesis subject. “The abstract is of utmost importance for it is read by 10 to 500 times more people than hear or read the entire article. It should not be a mere recital of the subjects covered, replete with such expressions as “is discussed” and “is described.” It should be a condensation and concentration of the essential qualities of the paper.”

Introduction

The introduction orients the reader to your thesis. It should present the nature and scope of the problem in terms of applications to ‘real world’ problems (what motivates the study); refer briefly to associated and relevant literature already published; state the method of investigation (the main technical issues, including important limitations in scope); and describe the report that follows (a sort of road-map, so that the reader knows what’s to come). This is well shown in [1].

Figure 1.1: Example figure.

Literature Review

Methodology

Note that methodology varies according to project type. Consider the engineering tools you've learned throughout your degree in ANU to generate your results — this may also include the systems engineering approach.

3.1 Modelling

3.1.1 wings

3.2 Trajectory Optimisation

3.2.1 Model Setup

3.2.2 Constraints

3.2.3 Initialisation

3.2.4 Mesh Refinement

3.2.5 Solution

3.3 Control

3.3.1 LQR

3.3.2 Lateral Stabilisation

3.3.3 Hover

3.3.4 Level Flight

3.3.5 Landing Approach

3.4 Simulation Environment

3.4.1 Rotor Model

3.5 Safety Features

3.5.1 Altitude Floor

The Altitude floor is a minimum altitude that if exceeded with cease the control input overrides, returning control to the stock Ardupilot controller. Fig X *FIGURE OUT FIGURE AND NAMING

IN LATEX* show that the stock controllers do not wind up and the aircraft stably returns to the stock trajectory.

3.5.2 State Error Disconnect

another method for rejecting the landing sequence is if the norm of the state error surpasses a preset limit. This triggers in two cases, the first is the aircraft failing to track the trajectory ref figure X, the second being a mismatch in the initial condition for example if the trajectory had not been updated and was made for a different altitude approach.

Results and Analysis

When presenting your results, it is important that you organise them in an orderly manner to avoid clusters of information. Be critical and properly analyse what the results mean. Provide insightful discussion and explanation. Consider using other published articles to support or argue your results. Make sure it clear which work are yours and which are background materials. Also, include the implication of your results.

4.1 Experimental Results

4.2 Subheading 1

How to reference Figure 4.1.

Table 4.1: Table captions are above tables. Tables are to be centered on the page.

No	Student	Task
1	A	X
2	B	Y
3	C	Z

4.3 Analysis and Discussion

4.4 Subheading 2

4.4.1 How to do math equations

The well known Pythagorean theorem $x^2 + y^2 = z^2$ was proved to be invalid for other exponents. Meaning equation 4.1 has no integer solutions:

$$x^n + y^n = z^n$$

$$x^n + y^n = z^n \tag{4.1}$$

Conclusions and Future Development

Provide an answer to your research question or evaluation of overall results given. Discuss what worked well and did not work well in your research. Outline the limitations of approach, methodology, data or research. Give suggestions/recommendations for future work.

Appendix A: The First

Manage your references and present them here in order.

Appendix B: The Second

Manage your references and present them here in order.
